Patient Profile

Name: Mr. Saubhik Bhaumik

Age:

Gender: Male

Summary of Results

The comprehensive biochemical panel demonstrates values within reference limits, and the predictive model classifies the overall profile as **Normal**.

Detailed Test Explanations

Test	Normal Range	Result	Interpretation
Serum Bilirubin (Total)	0–12 mg/dL	0.9 mg/dL	Within normal limits; indicates no hemolysis or cholestatic injury.
Serum Bilirubin (Direct)	0–3 mg/dL	0.2 mg/dL	Normal; low conjugated bilirubin excludes biliary obstruction.
Serum Bilirubin (Indirect)	0–1 mg/dL	0.7 mg/dL	Normal; suggests no significant hemolysis or Gilbert syndrome.
SGPT (ALT)	13–40 U/L	36 U/L	Upper-normal; may reflect mild hepatic stress but within accepted range.
SGOT (AST)	0–37 U/L	32 U/L	Upper-normal; similar to ALT, no overt hepatocellular injury.
Serum Alkaline Phosphatase	–	–	Value not reported; cannot assess bone or cholestatic markers.
Serum Protein	6.4–8.3 g/dL	7.2 g/dL	Normal; adequate protein synthesis.
Serum Albumin	3.5–5.2 g/dL	4.7 g/dL	Within reference; good synthetic liver function and nutritional status.
Globulin	1.8–3.6 g/dL	2.5 g/dL	Normal; balanced immune protein production.
A/G Ratio	1–2.4	1.88	Normal; suggests balanced albumin and globulin synthesis.

Overall Interpretation

All available laboratory findings fall within established normal ranges, and the predictive model identifies the profile as **Normal**. The elevated but still within-range ALT and AST suggest no significant hepatic injury. Absence of serum

alkaline phosphatase data limits a complete assessment of cholestatic or bone activity, yet the normal bilirubin, albumin, and globulin parameters reinforce overall hepatic health.

Recommendations

- Continue maintaining a balanced diet rich in fruits, vegetables, and adequate protein.
- Limit alcohol intake and avoid hepatotoxic medications where possible.
- Engage in regular physical activity and monitor weight to reduce potential liver strain.
- If future liver enzyme elevations appear, repeat testing and consider further evaluation.
- If serum alkaline phosphatase becomes available, review for bone or biliary assessment.
