

Patient Profile

Name: Yash M. Patel

Age: 21 years

Gender: Not specified

Summary of Results

The predictive model evaluated the patient's laboratory profile as **within normal limits**.

Detailed Test Explanations

AST (Aspartate Transaminase) – An enzyme released by hepatocytes during cellular injury. Elevated levels (beyond the reference range of 0–40 U/L) suggest hepatic inflammation or damage, whereas low levels are uncommon and typically reflect severe hepatic failure, requiring careful interpretation.

Result: Data not provided.

ALT (Alanine Transaminase) – A liver-specific enzyme; higher values relative to the reference range (0–40 U/L) are more directly associated with hepatocellular injury, particularly from fatty liver disease, viral hepatitis, or toxin exposure.

Result: Data not provided.

Overall Interpretation

The available data, when analyzed by the predictive model, indicate an overall normal hepatic assessment. However, the absence of measured AST and ALT results limits definitive confirmation of liver status. The accompanying medical remarks propose a potential non-alcoholic fatty liver disease (NAFLD) diagnosis based on presumed elevations in these enzymes, underscoring the need for complete laboratory evaluation before definitive conclusions can be drawn.

Recommendations

- Complete Liver Function Testing:** Obtain AST, ALT, alkaline phosphatase, bilirubin, and GGT values to clarify hepatic health.
- Imaging and Biomarker Assessment:** If liver enzymes remain elevated, consider liver ultrasound or FibroScan to evaluate steatosis and fibrosis.
- Lifestyle Modifications:**
 - Adopt a balanced diet rich in whole grains, lean protein, and plenty of fruits and vegetables while limiting saturated fats and refined sugars.
 - Maintain a healthy weight through regular aerobic activity (≥ 150 min/week) and resistance training.
 - Limit alcohol intake to less than one drink per day, if any.
- Follow-Up:** Schedule a repeat assessment in 3–6 months to monitor liver enzymes and metabolic parameters (fasting glucose, lipid profile).
