

Patient Profile

Name: Saubhik Bhaumik

Age: Not specified

Gender: Male

Summary of Results

All laboratory parameters are within normal reference ranges, indicating no evidence of hepatic dysfunction or protein metabolism abnormalities at this time.

Detailed Test Explanations

- **Total Bilirubin:** A measure of total bilirubin in the bloodstream; values above the upper limit may suggest hemolysis, liver dysfunction, or biliary obstruction. *Result: 0.9 mg/dL (normal).*
- **Direct Bilirubin:** Conjugated bilirubin cleared by the liver; elevated levels may indicate cholestasis or biliary disease. *Result: 0.2 mg/dL (normal).*
- **Indirect Bilirubin:** Unconjugated bilirubin; higher concentrations may reflect increased red-cell breakdown or impaired hepatic conjugation. *Result: 0.7 mg/dL (normal).*
- **ALT (SGPT):** Enzyme released when hepatocytes are injured; high levels can signal viral hepatitis, fatty liver, or drug-induced liver injury. *Result: 36 U/L (normal).*
- **AST (SGOT):** Similar to ALT, reflects liver or cardiac injury; ratios relative to ALT can aid differential diagnosis. *Result: 32 U/L (normal).*
- **Total Protein:** Represents the sum of albumin and globulins; deviations can indicate liver disease, nephrotic syndrome, or malnutrition. *Result: 7.2 g/dL (normal).*
- **Albumin:** Primary plasma protein produced by the liver; low levels may indicate liver dysfunction, chronic disease, or protein loss. *Result: 4.7 g/dL (normal).*
- **Globulin:** Includes immunoglobulins and other proteins; altered ratios can suggest immune disorders or chronic inflammation. *Result: 2.5 g/dL (normal).*
- **A/G Ratio:** Ratio of albumin to globulin; used to screen for protein-losing disorders and liver disease. *Result: 1.88 (normal).*

Overall Interpretation

The comprehensive biochemical profile demonstrates normal hepatic function, adequate protein synthesis, and no evidence of hemolysis or cholestasis. The patient's liver enzymes are within expected limits, and protein fractions are balanced, reflecting a healthy metabolic state.

Recommendations

- Maintain a balanced diet rich in fruits, vegetables, whole grains, and lean proteins to support liver health.
- Limit alcohol intake and avoid hepatotoxic medications unless medically indicated.
- Engage in regular physical activity (at least 150 minutes of moderate exercise weekly).
- Schedule routine check-ups and liver function monitoring if you have risk factors such as obesity, diabetes, or a history of medication use affecting the liver.
