Patient Profile

DUMMY (Age: , Gender:)

Summary of Results

This report summarizes liver function tests for patient DUMMY. The predictive model assessed this profile as **Normal**.

Detailed Test Explanations

LIVER PANEL 1; LFT; SERUM

A screening panel assessing liver health including AST, ALT, Alkaline Phosphatase, Bilirubin, and Protein levels.

AST (SGOT)

Indicates liver cell damage. Normal range: 15-40 U/L. Patient result: <10 U/L (below normal). Suggests no significant hepatocellular injury.

ALT (SGPT)

Primary liver enzyme. Normal range: 10-49 U/L. Patient result: <10 U/L (below normal). Consistent with normal liver function.

AST:ALT Ratio

Calculated ratio of AST to ALT. Normal range: <1.00. Patient result: 1.00 (within normal limits). Not indicative of advanced fibrosis.

GGT

Assesses biliary and hepatocellular injury. Normal range: 0-73 U/L. Patient result: <10 U/L (below normal). No biliary obstruction.

Alkaline Phosphatase (ALP)

Evaluates bone and liver health. Normal range: 30-120 U/L. Patient result: <30 U/L (below normal). Not suggestive of cholestasis.

Bilirubin Total

Reflects conjugated and unconjugated bilirubin. Normal range: 0.30-1.20 mg/dL. Patient result: 0.90 mg/dL (within normal limits). No hemolysis or hepatic obstruction.

Bilirubin Direct

Conjugated bilirubin component. Normal range: <0.3 mg/dL. Patient result: 0.20 mg/dL (within normal limits). Indicates no cholestasis.

Bilirubin Indirect

Unconjugated bilirubin component. Normal range: <1.10 mg/dL. Patient result: 0.70 mg/dL (within normal limits). Consistent with normal heme metabolism.

Total Protein

Assesses overall protein status. Normal range: 5.70-8.20 g/dL. Patient result: >12.00 g/dL (above normal). Requires clinical correlation for significance.

Albumin

Major plasma protein synthesized by liver. Normal range: 3.20-4.80 g/dL. Patient result: 2.00 g/dL (below normal). Indicates possible synthetic dysfunction.

A:G Ratio

Albumin-to-globulin ratio. Normal range: 0.90-2.00. Patient result: 0.10 (below normal). Suggests hypoproteinemia or hyperglobulinemia.

Overall Interpretation

Liver enzyme and function test results show predominantly normal values, with elevated Total Protein and low Albumin and A/G ratio requiring further clinical evaluation. The AST:ALT ratio (1.00) is not indicative of advanced liver disease.

Recommendations

Health Navigator • AI Medical Assistance
Monitor liver function periodically. Investigate causes of hypoproteinemia and assess nutritional status. Consider follow-up with a hepatologist if abnormalities persist. Maintain regular health

screenings
